Ceramic Fiber Modules & Module Panels

As a lining for Heat Treating furnaces, Ceramic kilns, Ladle covers, Forge furnaces, Incineration equipment, Aluminum furnace doors, Annealing furnaces and Boilers, customers realize advantages compared to refractory construction. These benefits are faster temperature cycling, lower heat storage, increased productivity, lower installed cost, easier repairs, better temperature uniformity and lower fuel costs.

Besides manufacturing the standard 12"x12" or 12"x24" modules, we have made modules up to 79" long. We have also constructed various sized ceramic fiber module panels with different metal encasements in our facility to ship to job sites. This saves the customer time & money by just replacing the complete lid or door rather than having a contractor on site.

Feel free to contact us for any high temperature requirement you may have. We'll be glad to help provide a better lining with our thermal products.
